

WRITING 2 – MATERIALS AND PROCESS

Street Photography with just an IPHONE 5s

To take a snap of street photograph, there are quick and easy eight steps to follow. First, start off by choosing a location, which is "suitable" for capturing the world without busyness of colours. Remember to always select a location with a range of lighting conditions. Second, explore the location and pick a spot where the subjects of your photograph could feel less disturbed by your presence. After that, instead of the zoom lens which is often the most noticeable element of a professional camera, use the camera lens of an iphone 5s so that the people will not notice the shoot. Then, when people start entering the scene, choose your focal subject wisely. It is vital to keep in mind that a good combination of lights in the shot often results from the casting shadows and the flowing lines in the composition. Finally, after the shoot, always keep the camera still as if you are still framing what is behind or a little to the side of the subjects. With these simple equipments and steps, even where the dullest of scenes such as local market is expected, it is always possible that such place can become an excellent showcase of beauty.
